Kafka pairwise domain/range cardinality combinations instance generation results

Generation of instances by combining every value that the cardinality of the domain set and range set can take, for every relation pair.

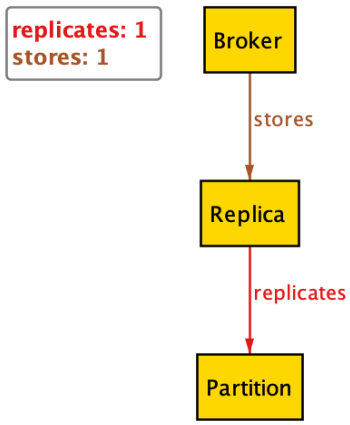
- isOneOne defines a 1 to 1 relationship where #domain = #range = 1
- isOneMany defines a 1 to Many relationship where #domain = 1, #range = 2
- isManyOne defines a Many to 1 relationship where #domain = 2, #range = 1
- ***NOTE**:* isManyMany is not strictly equivalent to a many-many relation. It just means that #domain = 2 and #range=2.

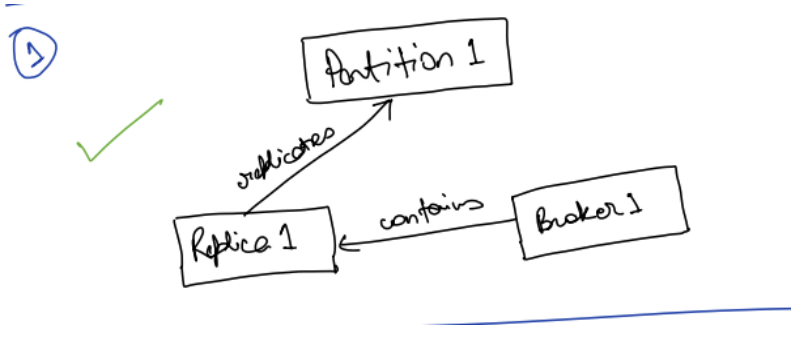
Approach

- The main idea is to constrain any given pair of relations by applying any of the four predicates to each relation: [isOneOne, isOneMany, isManyOne, isManyMany]
- For a pair of relations, there will be total 4 x 4 = 16 constraints
- For `n` relations: total nC2 * 16 constraints = 8n * (n - 1) constraints

Constraint 1

```
run constraint1 {
        isOneOne[replicates]
        isOneOne[stores]
}
```





Constraint 2

run constraint2 {
	isOneOne[replicates]
	isOneMany[stores]
}

Only one replica exists in the system because of `replicates: one Partition` and `isOneOne[replicates]`, therefore multiple replicas in range of `stores` is not possible.

```
Executing "Run constraint2"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 60ms.
   No instance found. Predicate may be inconsistent. 22ms.
```

Constraint 3

run constraint3 {
	isOneOne[replicates]
	isManyOne[stores]
}

Stores cannot be many-to-one as the definition of stores disallows any shared replicas between any two brokers (`stores: disj set Replica`)

```
Executing "Run constraint3"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 50ms.
   No instance found. Predicate may be inconsistent. 14ms.
```

Constraint 4

```
run constraint4 {
        isOneOne[replicates]
        isManyMany[stores]
}
```

Only one replica exists in the system because of `replicates: one Partition` and `isOneOne[replicates]`, therefore multiple replicas in range of `stores` is not possible.

```
Executing "Run constraint4"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 50ms.
   No instance found. Predicate may be inconsistent. 10ms.
```

Constraint 5-7

```
run constraint5 {
        isOneMany[replicates]
        isOneOne[stores]
}

run constraint6 {
        isOneMany[replicates]
        isOneMany[stores]
}

run constraint7 {
        isOneMany[replicates]
        isManyOne[stores]
}

run constraint8 {
        isOneMany[replicates]
        isManyMany[stores]
}
```

isOneMany[replicates] is not possible, because of explicit many-to-one relationship in `replicates: one Partition`

```
Executing "Run constraint5"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 78ms.
   No instance found. Predicate may be inconsistent. 12ms.
```

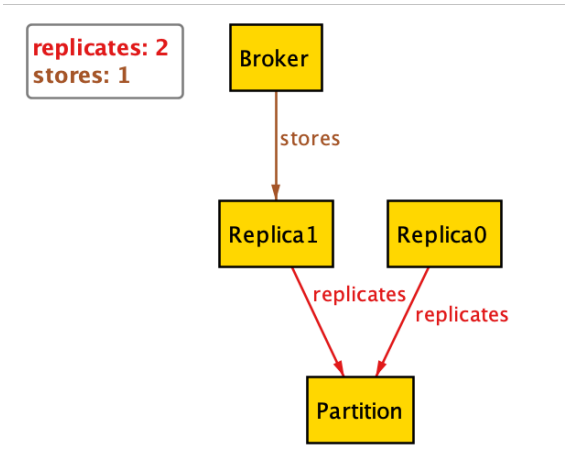
```
Executing "Run constraint6"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 51ms.
   No instance found. Predicate may be inconsistent. 14ms.
```

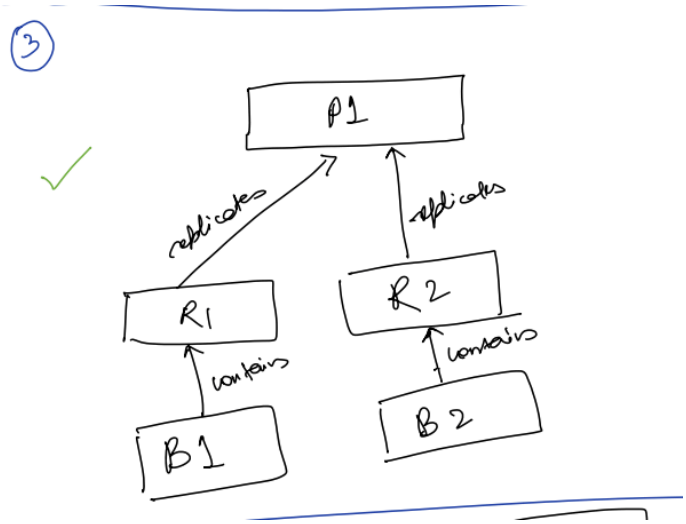
```
Executing "Run constraint7"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 37ms.
   No instance found. Predicate may be inconsistent. 5ms.
```

```
Executing "Run constraint8"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 58ms.
   No instance found. Predicate may be inconsistent. 7ms.
```

Constraint 9

run constraint9 {
	isManyOne[replicates]
	isOneOne[stores]
}





Constraint 10

```
run constraint10 {
        isManyOne[replicates]
        isOneMany[stores]
}
```

Only one replica exists due to isManyOne and `replicates: one Partition`, therefore cannot store many replicas in `stores`

```
Executing "Run constraint10"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 62ms.
   No instance found. Predicate may be inconsistent. 30ms.
```

Constraint 11

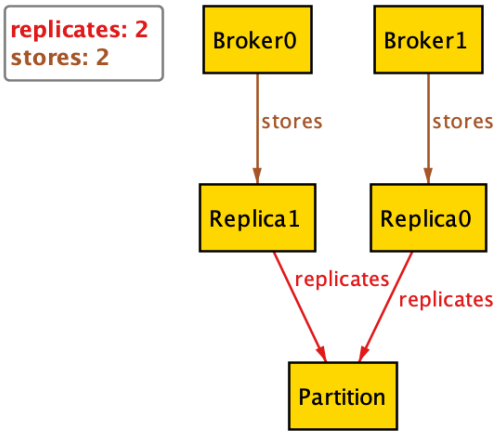
```
run constraint11 {
        isManyOne[replicates]
        isManyOne[stores]
}
```

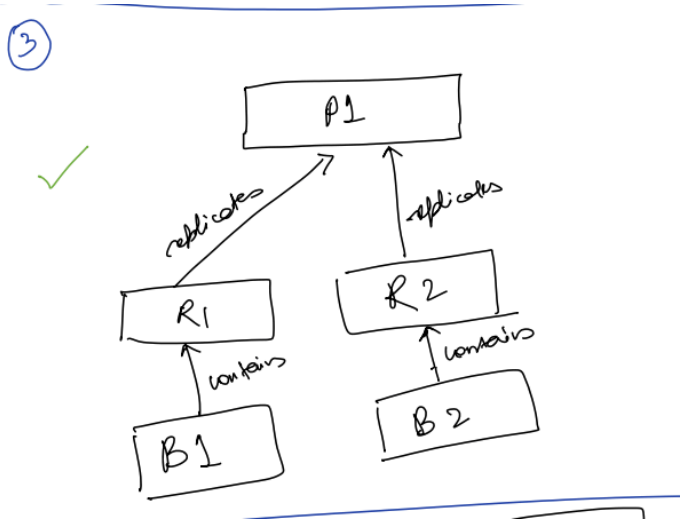
Stores cannot be Many-One because `stores: disj set Replica`

```
Executing "Run constraint11"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 29ms.
   No instance found. Predicate may be inconsistent. 4ms.
```

Constraint 12

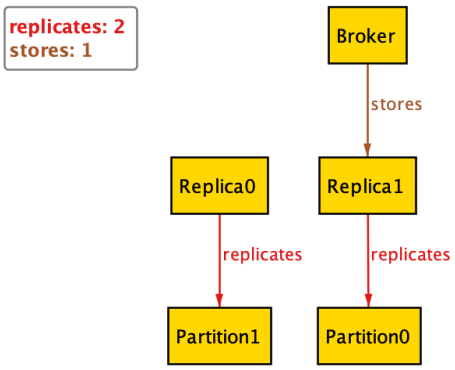
```
run constraint12 {
        isManyOne[replicates]
        isManyMany[stores]
}
```





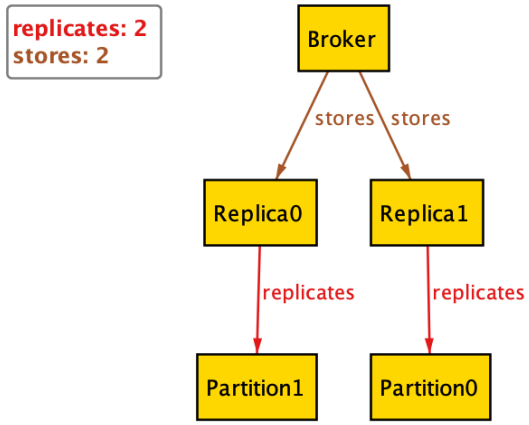
Constraint 13

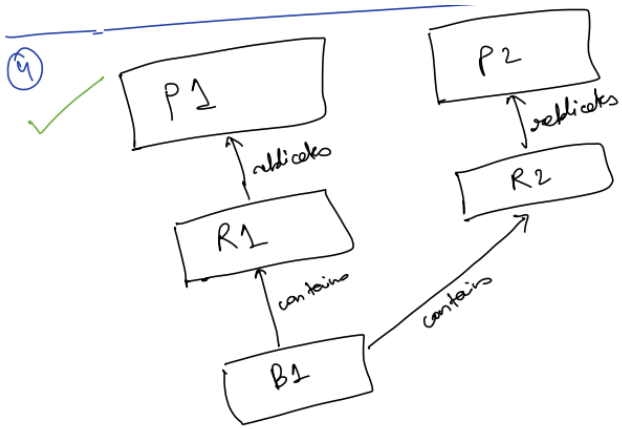
```
run constraint13 {
        isManyMany[replicates]
        isOneOne[stores]
}
```



Constraint 14

```
run constraint14 {
        isManyMany[replicates]
        isOneMany[stores]
}
```





Constraint 15

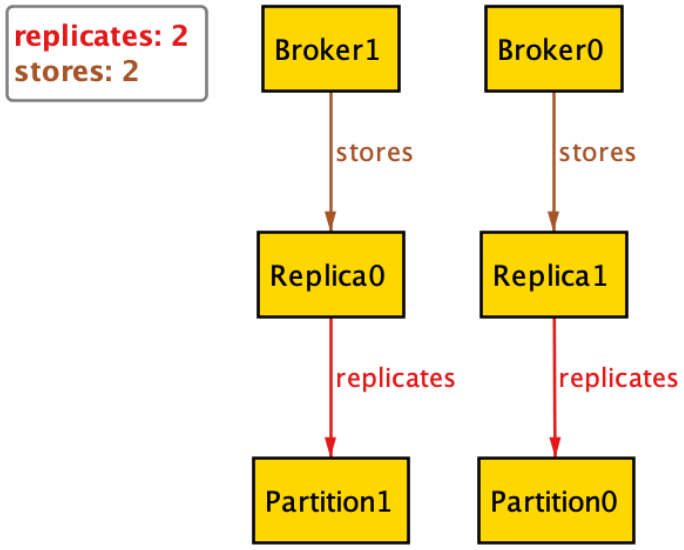
```
run constraint15 {
        isManyMany[replicates]
        isManyOne[stores]
}
```

Stores cannot be Many-One because `stores: disj set Replica`

```
Executing "Run constraint15"
   Solver=sat4j Bitwidth=4 MaxSeq=4 SkolemDepth=1 Symmetry=20
   351 vars. 27 primary vars. 633 clauses. 44ms.
   No instance found. Predicate may be inconsistent. 5ms.
```

Constraint 16

```
run constraint16 {
        isManyMany[replicates]
        isManyMany[stores]
}
```



Conclusion

All expected instances and a few more appear with this instance generation approach.
